Up to now, HIV-2 sequences have been derived almost solely from cultured isolates. Since cultivation may select against viruses which can not grow in a particular cell type, Gao et al. argue that a greater variation may be elucidated by sequencing virus obtained from uncultured PBMCs. With this aim in mind, peripheral blood samples were collected from 12 HIV-2 seropositive patients (2238, 60415K, 60667K, 7312A, 7810A, 7924A, FA, FO784, FT, JA, ON, and PA) from six different West African countries, living in both urban and rural areas. Uncultured PBMC DNA was PCR amplified, and the recombinant clones were manually sequenced. Another portion of the Patient 60667K was a heterosexual 37-year old female from Sierra Leone, who was living in the Washington, D.C. area. Originally she lived in an urban area in West Africa before traveling extensively and coming to the United States. After seeking medical care for a STD, patient 60667K was identified as HIV-2 positive. She had children were seronegative. Western blot analysis of patient 60667K was blood cells showed HIV dual reactivity. Virus isolation was successfully performed at the University of Alabama at Birmingham. Sample 60667K clusters with the subtype B viruses.

                                                                                                                                                                                                                                   Kindly provided prior to publication by Shaw and Hahn, University of Alabama. YU2 clusters with HIV-1 B subtype sequences. Four full-length genomes were cloned from uncultured brain [1] and compared [2]. YU2, unlike three of the minimally defective clones (see <HIVYUI0>), was found to be replication competent and macrophage tropic. 10 nonsynonymous nucleotide differences are found between YU2 and YU10, 7 of which are seen in the env cds.

New isolated Murc polypeptide from Staphylococcus aureus and related nucleic acid - useful in diagnosis, treatment and prevention of bacterial infections

Claim 2; Pages 3-4; 39pp; English.

Claim 2; Pages 3-4; 39pp; English.

The present sequence represents a MurC gene encoding a Staphylococcus aureus UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide). Host cell containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or

Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide or accompetitive polypeptide are useful for inhibiting the polypeptide or bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The MurC gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant MurC gene; for chromosomal mapping; to determine bacterial serotype; and for genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunisation

anti-S.aureus vaccines claim 1; Page 1287-1288; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The
                                                                                                                                                                                                                                                                                                                                                                                                                                   30-JUL-1997.

S.aureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, skin and surgical wound infections, scaled skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences

PS Claim 2; Pages 4-5; 39pp; English.

CC The invention relates to a UDP-N-acetylmuramate:L-alanine ligase CC (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells CC containing an expression system comprising the MurC gene can be used for CC crecombinant production of the polypeptide. Agonists or the MurC CC polypeptide are used to treat conditions requiring increased activity or CC expression of the polypeptide Antagonists, inhibitory nucleic acid or CC competitive polypeptide are useful for inhibiting the polypeptide e.g. CC bacterial (especially S. aureus) infections. They are also useful against CC The antibacterial agents are useful to treat in-dwelling devices for CC infection prevention or generally as wound treatments to prevent adhesion CC infection prevention or generally as wound treatments also useful for Alannosing or producing (susceptibility to) disease, for radising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş

This sequence encodes a Staphylococcus aureus protein of unknown function, and represents a DNA Sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection. ```
CC by a process comprising: (a) screening a genomic DNA library using as a CC probe a target sequence defined by any of the sequences in SEQ ID NO:1 CC to 391, identifying members of the library which contain sequences CC that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced CC from an organism, amplifying nucleic acid molecules whose nucleotide CC sequence is homologous to amplification primers derived from the CC fragment of the S. pneumoniae genome to prime the amplification and CC isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome. Products from the present compositions and vaccines for S. pneumoniae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a processor of the sequence of any of the fragments of the S.pneumoniae because of the sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1219
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptococcus pneumoniae; computer readable medium;

A computer readable medium has been developed which has recorded on it

Search and the sequences isolated from the Enterococcus faecalis genome.

Callos to X13919 represent these nucleotide sequences which are primary concleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence cof Enterococcus faecalis in samples. They can also be used for commercial importance infection in an animal and monitoring comparession of disease, and for identifying agents which can be used to mobilate the growth or pathogenicity of Enterococcus faecalis, or can other related organism, in vivo or in vitro. In particular the collypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a protein from Streptococcus pneumoniae. CC The nucleic acid sequence encoding the Streptococcus pneumoniae protein CC can be useful in vaccines for inducing protective antibodies against CC Streptococcus pneumoniae, for treatment or prevention of infection e.g. CC pneumonia, otitis media or meningitis. Probes based on the nucleic acid CC are used to detect Streptococcus infection (by usual hybridisation or CC amplification methods), also for isolating Streptococcus genes or their CC allelic variants. The protein can be used similarly to detect specific CC antibodies in standard immunoassays, especially for diagnosing or CC monitoring infections. Antibodies which bind the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, CC e.g. by injection, orally or through the skin, typically at 0.01-1000 CC (especially 10-300) mu g/ml per dose.

Claim 1; Page 1327-1330; 2084pp; English.

A computer readable medium has been developed which has recorded on it

Ba nucleotide sequences isolated from the Enterococcus faecalis genome.

CX 12938 to X13919 represent these nucleotide sequences which are primary

CX nucleotide sequences, also known as contigs. The computer based system

CX can identify fragments of the Enterococcus faecalis genome with

CX commercial importance. The products can be used to detect the presence

CX of Enterococcus faecalis in samples. They can also be used for

CX diagnosing Enterococcal infection in an animal and monitoring

CX progression of disease, and for identifying agents which can be used to

CX modulate the growth or pathogenicity of Enterococcus faecalis, or

CX canother related organism, in vivo or in vitro. In particular the

CX polypeptides encoded by the Enterococcus faecalis nucleotide sequences

CX can be used in vaccines to prevent or attenuate an Enterococcal

The sequence is that of a Streptococcal polypeptide coding region. The polypeptide can potentially be used for the diagnosis and prevention of bacterial infections, especially Sp infection. It may be used for the treatment of diseases such as otitis media, conjunctivitis, pneumonia, bacteremia, meningitis, sinusitis, pleumempyema, endocarditis or infection of the cerebrospinal fluid. CC useful as potential H. pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To CC identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide Production, e.g. in E. coli hosts.

Note: This DNA sequence is not reproduced in the specification and the related specification, w09719098.

used for diagnostics and therapeutics Claim 1; Page 77; 235pp; English.
This sequence encodes an H. pylori cytoplasmic protein involved in outer membrane or cell wall biosynthesis. This sequence showed homology to N-acetylmuramate-Alanine ligase. Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention
                                                                                                                                                                                                      P-PSDB; W24585.

              Helicobacter pylori nucleic acid sequences and related polypeptide(s) - useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter claim 9; Page 752; 1481pp; English.

The present sequence encodes a Helicobacter pylori cytoplasmic protein involved outer membrane or cell wall biosynthesis. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pylori or for use in detecting the presence of Helicobacter species in a sample. Antisense nucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMPX vectors, while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts were ligated to each of the 20 pMPX vectors to construct a series of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine; prevention; treatment; infection; identification; binding compound; bacterium; life cycle; activator; bacteria; inhibitor; duodenal ulcer disease; chronic gastritis; diagnos

The present invention describes a computer readable medium which has CC the nucleotide sequences SEQ ID NO:1 to 391 (Y52134 to Y52524) recorded CC on it, or a representative fragment or a sequence at least 95% identical CC to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391 (Y52134 to Y52524) are genomic fragments from Streptococcus CC pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae CC genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a CC probe a target sequence defined by any of the sequences in SEQ ID NO: 1 to 391, identifying members of the library which contain sequences CC that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or cDNA produced CC molecules from the members; or (b) isolating primers derived from the sequences is homologous to amplification primers derived from the computer based system for identifying fragments of the S. pneumoniae genome to prime the amplification and CC isolating the amplified sequences. The computer readable medium can be CS. pneumoniae genome of commercial importance, or expression modulating CC sequents of the S. pneumoniae genome. Products from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   õ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodies a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for Inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, otitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or camplification methods), also for isolating Streptococcus genes or their callelic variants: The protein can be used similarly to detect specific menitodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive climmunisation (optionally coupled to a toxin). Vaccines are administered, c.g. by injection, orally or through the skin, typically at 0.01-1000 cc (especially 10-300) mu g/ml per dose.

Example 1; Columns 1-4; 13pp; English.
The present sequence represents DNA encoding Streptococcus pneumoniae
MurD protein (uridine-diphosphate-N-acetylmuramyl-L-alanyl-D-isoglutamate
ligase). The murD protein is useful in a method for identifying compounds
that inhibit Streptococcus pneumoniae murD activity. Compounds
identified are potentially useful as antibacterial agents.
